                    Visual Validation Report
             Connectomics Split-Detection Pipeline

                Source:  output/xpress_training
          Volume:  data/xpress/baseline_seg_training.h5
     Raw EM: not provided — Panel 1 shows neutral segmentation
          Skeleton: data/xpress/XPRESS_training_skels.npz

Candidates:  369,570 total  |  Accepted: 368,181  |  Rejected: 1,389

                  Sample shown: 30 candidates
                       • Ground-truth TP: 5
                  • High-confidence accepted: 5
                   • Low-confidence accepted: 5
                     • Borderline rejected: 5
                            • GT FN: 5
                     • Random rejected: 5

 Ground-truth: skeleton file loaded — TP/FP/FN/TN shown in Panel 3

  ─── Panel layout (3 columns per candidate row) ─────────────────
                     Panel 1 — Raw / Neutral:
        Grayscale EM (if available) or neutral segmentation.
      Yellow dots/lines = skeleton nodes/edges near the Z-slice.
         Use this to assess: what does the tissue look like?

                  Panel 2 — Pipeline Prediction:
        Red = Fragment A,  Blue = Fragment B,  Gray = others.
             White arrow = proposed merge direction A→B.
                   Badge: ACC (green) or REJ (red).
          Title shows all 5 score components + gap distance.

                      Panel 3 — Ground Truth:
              Same seg coloring + ground-truth overlay.
      TP (green)  = correct accept  — pipeline & GT agree: merge
      FP (red)    = false accept    — pipeline merged, GT says no
    FN (orange) = missed merge    — pipeline rejected, GT says merge
      TN (gray)   = correct reject  — pipeline & GT agree: no merge
  Bright yellow skeleton = neuron(s) passing through fragment A or B.
         Dashed yellow line = GT crossing (for TP/FN pairs).

  ─── How to inspect ─────────────────────────────────────────────
        1. Look at Panel 1 to understand the tissue context.
     2. In Panel 2, check if fragments A and B plausibly belong
      to the same neuron (do they touch? Are shapes continuous?).
   3. In Panel 3, verify the ground truth: does the skeleton cross
       from one fragment into the other? For FP/FN cases, examine
       whether the pipeline's score values explain the error.
